

**If you can observe only one evening celestial event
this month, consider this one:**

**South-southwest
75 minutes after sunset
on Nov. 11 & 12.**

**View through
10x50 binoculars**

Venus reveals celestial treasures

Look to the south-southwest 75-90 minutes after sunset.

- On November 11 & 12, look for Venus low in the south-southwest. It will be the brightest object in the area.
- Use binoculars to view Venus. To its immediate upper right, subtly glows a nebulous star cluster, M8, nicknamed "the Lagoon Nebula" (4100 L-Y distant).
- To the upper right of M8 dimly glows another star forming nebula and cluster, M20, called "the Trifid Nebula" (5200 L-Y distant).
