

Asterisms in Sagittarius

Have fun with Sagittarius. Make it yours!

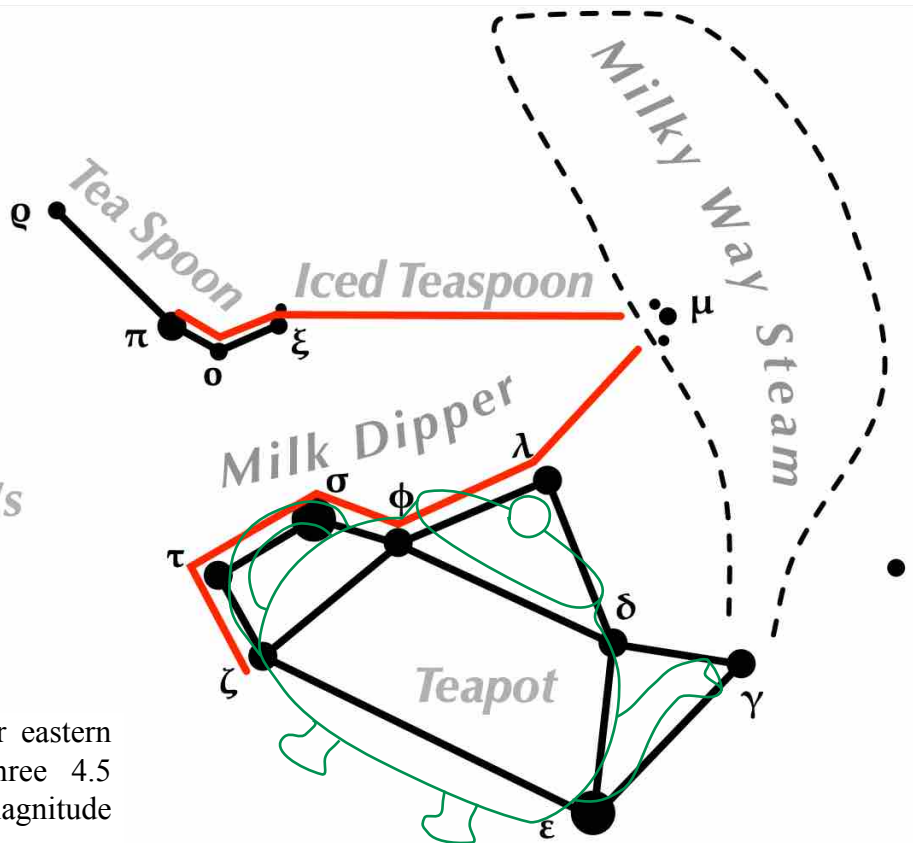

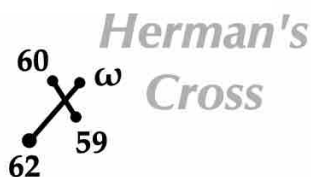

Sagittarius is found very low in the south-southeast in the early evening in July, south in August, and south-southwest in September. Look for the Teapot shape. The rest extends southeast.

Can you trace the original constellation, Sagittarius, the Archer? It's not easy!

- Can you spot the Teapot with steam (Milky Way star clouds and nebulae) rising out of its spout?
- Can you trace the Tea Spoon and the Milk Dipper?
- How about the lesser known Ice Tea Spoon? (More suitable than a teaspoon for summertime tea.)

- And Herman's Cross in far eastern Sagittarius consisting of three 4.5 magnitude stars and the 4.7 magnitude Omega Sagittarii?

**Create your own asterisms,
ones that will greet you every time you gaze at this part of the sky!**
