

# *Carpe Lunam!* Exploring the moon

An unusual shaped feature, this straight, sixty mile long mountain range is found just to the west–southwest of crater Plato at the northern edge of Mare Imbrium. Some observers in the 19th century thought it was an artificial construct, implying that life existed on the moon.

Use as much magnification as the telescope and the seeing conditions will stand.

What is its name?

- A. Montes Recti
- B. Rupes Recta
- C. Lunar Highlands
